Complex Numbers in Geometry. In plane geometry, complex numbers can be used to represent points, and thus other geometric objects as well such as lines, circles, and polygons. They are somewhat similar to Cartesian coordinates in the sense that they are used to algebraically prove geometric results, but they are especially useful in proving results involving circles and/or regular polygons (unlike Cartesian coordinates, which are useful for proving results involving lines).

A complex number is a number of the form $a + bi$, where a and b are real numbers, and i is an indeterminate satisfying $i^2 = -1$. For example, $2 + 3i$ is a complex number. This way, a complex number is defined as a polynomial with real coefficients in the single indeterminate i , for which the relation $i^2 + 1 = 0$ is imposed. Based on this definition, complex numbers can be added and multiplied, using the addition and multiplication for polynomials.

coordinates $A_1 = 3 \cos 45 = 2.121$ and $B_1 = 3 \sin 45 = 2.121$
P2 has coordinates $A_2 = 2 \cos 30 = 1.732$ and $B_2 = 2 \sin 30 = 1.0$.
 $P_1 = 2.121 + j 2.121$ and $P_2 = 1.732 + j1$.

3The term ‘ complex number ’ is due to the German mathematician Carl Gauss (1777-1855). Gauss is considered by many the greatest mathematician ever. He made major contributions to almost every area of mathematics from number theory and non-Euclidean geometry, to astronomy and magnetism.

Complex analysis is one of the classical branches in mathematics, with roots in the 18th century and just prior. Important mathematicians associated with complex numbers include Euler, Gauss, Riemann, Cauchy, Weierstrass, and many more in the 20th century.

Complex numbers are often represented on the complex plane, sometimes known as the Argand plane or Argand diagram. In the complex plane, there are a real axis and a perpendicular, imaginary axis.

The beautiful Mandelbrot Set (pictured here) is based on Complex Numbers.. It is a plot of what happens when we take the simple equation $z^2 + c$ (both complex numbers) and feed the result back into z time and time again.. The color shows how fast $z^2 + c$ grows, and black means it stays within a certain range.. Here is an image made by zooming into the Mandelbrot set

Complex Numbers and the Complex Exponential 1. Complex numbers The equation $x^2 + 1 = 0$ has no solutions, because for any real number x the square x^2 is nonnegative, and so $x^2 + 1$ can never be less than 1. In spite of this it turns out to be very useful to assume that there is a number i for which one

But the amazing thing is that “ pure ” theory of complex numbers, complex functions and complex analysis has applications almost everywhere you look, and not just within mathematics. If you have studied physics, you may already have met complex numbers and functions when looking at impedance, phase angles, and oscillating currents.
