The Doppler Effect When ultrasound

interacts with a moving object (i.e. red blood cells) the reflected frequency changes. If the cells are traveling towards the transducer the ultrasound wave is "squashed" f_r and f_r giving a positive Doppler shift. If R's are traveling away the wave is "stretched" f_r and f_r

instrumentation will provide the user with a better understanding of the capabilities and limitations of ultrasound equipment.

The ultrasound machine combines two technologies: image production (M-mode and 2-dimensional imaging) with Doppler assessment (continuous and pulse wave as well as color-flow mapping).
